 - Agent
- 2 Utility Theory
 - Preference
- 3 Decision
 - Decision
- 4 Value of Information
 - Uncertainty Reduction

Agent

- State
- Action
- Consequence
- Goal
- Utility

Maximize Expected Utility

Application

Algorithmic trading

High frequency trading

Outline

- 1 Introduction
 - Agent
- 2 Utility Theory
 - Preference
- 3 Decision
 - Decision
- 4 Value of Information
 - Uncertainty Reduction

Preference

Model agent's preference

- $A \succ B$ the agent prefer A over B
- $A \sim B$ the agent is indifferent between A and B
- $A \succsim B$ the agent prefers A over B or is indifferent between them

Lottery

$$L = [p_1, S_1; p_2, S_2; \cdots p_n, S_n]$$

- a set of outcomes $\{S_1, S_2, \cdots S_n\}$
- each outcome occurs a probability p_i
 - $\sum_{i=1}^n p_i = 1$
- each outcome S_i can either be an atomic state or another lottery

Principles

- **Orderability**

- Exactly one of $(A \succ B)$, $(A \prec B)$, or $(A \sim B)$ holds.

- **Transitivity**

- $(A \succ B) \wedge (B \succ C) \implies (A \succ C)$.

- **Continuity**

- $A \succ B \succ C \implies \exists p[p, A : 1 - p, C] \sim B$.

Principles

- **Substitutability**

- $A \sim B \implies [p, A; 1 - p, C] \sim [p, B; 1 - p, C].$

- **Monotonicity**

- $A \succ B \implies (p > q \iff [p, A; 1 - p, B] \succ [q, A; 1 - q, B]).$

- **Decomposability**

- $[p, A; 1 - p, [q, B; 1 - q, C]] \sim [p, A; (1 - p)q, B; (1 - p)(1 - q), C].$

From Preference to Utility

Existence of Utility Function

- $U(A) > U(B) \iff A \succ B$
- $U(A) = U(B) \iff A \sim B$

From Preference to Utility

Expected Utility of a Lottery

$$U([p_1, S_1; \cdots ; p_n, S_n]) = \sum_i p_i U(S_i)$$

Outline

- 1 Introduction
 - Agent
- 2 Utility Theory
 - Preference
- 3 Decision
 - Decision
- 4 Value of Information
 - Uncertainty Reduction

Decision making

$$a^* = \arg \max_a EU(u \mid e, a)$$

Utility Function

- $U(S)$
- worst u_{\perp} and best u_{\top}
- standard lottery $[p, u_{\perp}; (1 - p), u_{\top}]$
- Risk-Seeking
- Risk-Averse
- Risk-Neutral

Utility Function

Bernoulli's Model of Different Risk Perspectives

Source: Begg, Bratvold and Campbell, *Decision-Making Under Uncertainty*

Multi-Attribute Utility

- Usually there are multiple attributes to be considered in decision making.
- **Example : New airport location**
 - the cost of the land
 - the distance from centers of population
 - the noise of flight
 - safety

Multi-Attribute Utility

A vector of attributes $\mathbf{x} = \langle x_1, \dots, x_n \rangle$

- **dominance** : better or equivalent in all the attributes \succsim
- **strict dominance** : better in all the attributes \succ
- **non-dominance** : at least better in one attributes than any other solution
 - Pareto-optimal

Multi-Attribute Utility

Outline

- 1 Introduction
 - Agent
- 2 Utility Theory
 - Preference
- 3 Decision
 - Decision
- 4 Value of Information**
 - Uncertainty Reduction**

Value of information

- the benefit from uncertainty reduction
- the cost of collecting information
- decision making
 - whether it is worth to collect the information
- **Example - oil drill**
